

An Earthquake Design Equation for Masonry Shear Walls in Shear

Gary C. Hart¹, Sampson C. Huang², Robert E. Englekirk³ and Suzanne M. Dow²

Abstract:

The paper describes a method whereby advances made in the understanding of earthquake loads & concrete masonry shear strength are the basis of a design formula for earthquake design of masonry shear walls. The development considers uncertainty in both the load & resistance sides of the design equation to achieve a level of structural reliability consistent with currently acceptable levels of societal risk.
